1. TEST STANDARDS AND TEST DESCRIPTION

1.1. Test Standards

The tests were performed according to following standards:

ANSI/IEEE C95.1: 2005:IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields,3 kHz to 300 GHz.

ANSI/IEEE C95.3: 2002:IEEE Recommended Practice for Measurements and Computations of Radio Frequency Electromagnetic Fields With Respect to Human Exposure to SuchFields,100 kHz—300 GHz.

IEEE1528:2013:Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate.

KDB447498 D01v06:General RF Exposure Guidance.

KDB248227 D01v02r02:802.11 Wi-Fi SAR.

KDB865664 D01v01r04:SAR measurement 100MHz to 6GHz.

KDB865664 D02v01r02:SAR Report.

KDB690783 D01v01r03:SAR lisitings on Grants.

KDB648474 D04v01r03:SARHandsets Multi Xmitter and Ant.

FCC Part 2:2012: frequency alloca-tions and radio treaty mat-ters; general rules and reg-ulations

1.2. Test Description

The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power . And Test device isidentical prototype.

1.3. Product Description

| | |
|-----------------------|---|
| Product Name: | SMART WATCH |
| Trade Mark: | FIFINE |
| Model/Type reference: | W9 |
| Listed Model(s): | Polaris smart watch, W9, W10, W11, W12, W13, W14, W15 |
| Software Version | X201_MB_V2.5 |
| Hardware Version | Fifine w9 v3 20150625 |
| Power supply: | DC 3.7V by battery(2000mAh) Adapter: Input: AC100-240V, 50/60Hz 0.2A; Output: DC 5V/1000mA |
| 2G | |
| Operation Band: | GSM850, PCS1900 |
| Supported type: | GSM/GPRS |
| Power Class: | GSM850:Power Class 5 PCS1900:Power Class 0 |
| Modulation Type: | GMSK for GSM/GPRS |
| GSM Release Version | R97 |
| GPRS Multislot Class | 12 |
| EGPRS Multislot Class | Not Supported |
| WIFI | |
| Supported type: | 802.11b/802.11g/802.11n(HT20) |
| Modulation: | 802.11b: DSSS 802.11g/802.11n:OFDM |
| Operation frequency: | 2412MHz~2462MHz |
| Channel number: | 11 |
| Channel separation: | 5MHz |
| Bluetooth | |
| Version: | Supported BT3.0 |
| Modulation: | GFSK(1Mbps) , π /4-DQPSK(2Mbps) , 8-DPSK(3Mbps) |
| Operation frequency: | 2402MHz~2480MHz |
| Channel number: | 79 |
| Channel separation: | 1MHz |

1.4. Summary SAR Results

Table 1:Max. SAR Measured

<Highest Reported standalone SAR Summary>

| Exposure Configuration | Technolohy Band | Highest Scaled SAR (W/Kg) | limit |
|--|-----------------|---------------------------|------------------|
| Next to mouth 1-g SAR (Separation Distance 10mm) | GSM850 | 0.201 | 1.6 1g(W/Kg) |
| | PCS1900 | 0.348 | |
| | WLAN2450 | 0.211 | |
| Wrist-worn 10-g SAR (Separation Distance 0mm) | GSM850 | 0.967 | 4.0 10g(W/Kg) |
| | GPRS850 | 0.907 | |
| | PCS1900 | 0.439 | |
| | GPRS1900 | 0.326 | |
| | WLAN2450 | 1.040 | |

The SAR values found for the Mobile Phone are below the maximum recommended levels of 1.6W/Kg as averaged over any 1g tissue according to the ANSI C95.1-1999.

For body worn operation, this device has been tested and meets FCC RF exposure guidelines when used with any accessory that contains no metal and which provides a minimum separation distance of 0mm between this device and the body of the user. Use of other accessories may not ensure compliance with FCC RF exposure guidelines.

The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power output

1.5. EUT operation mode

The EUT has been tested under typical operating condition and The Transmitter was operated in the normal operating mode. The TX frequency was fixed which was for the purpose of the measurements.

1.6. EUT configuration

The following peripheral devices and interface cables were connected during the measurement:

- - supplied by the manufacturer
- - supplied by the lab

| | | | |
|-----------------------|-------------|----------------|---|
| <input type="radio"/> | Power Cable | Length (m) : | / |
| | | Shield : | / |
| | | Detachable : | / |
| <input type="radio"/> | Multimeter | Manufacturer : | / |
| | | Model No. : | / |

2. TEST ENVIRONMENT

2.1. Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

Site Description

EMC Lab.

- : CNAS Registration Number. is L4595.
- FCC Registration Number. is 899208.
- Industry Canada Registration Number. is 9642A-1.
- VCCI Registration Number. is C-4260 and R-3804.
- ESMD Registration Number. is ARCB0108.
- UL Registration Number. is 100571-492.
- TUV SUD Registration Number. is SCN1081.
- TUV RH Registration Number. is UA 50296516-001

2.2. Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

| | |
|-----------------------|--------------|
| Temperature: | 18-25 ° C |
| Humidity: | 40-65 % |
| Atmospheric pressure: | 950-1050mbar |

2.3. SAR Limits

FCC Limit (1g Tissue)

| EXPOSURE LIMITS | SAR (W/kg) | |
|--|--|--|
| | (General Population / Uncontrolled Exposure Environment) | (Occupational / Controlled Exposure Environment) |
| Spatial Average(averaged over the whole body) | 0.08 | 0.4 |
| Spatial Peak(averaged over any 1 g of tissue) | 1.6 | 8.0 |
| Spatial Peak(hands/wrists/feet/anklesaveraged over 10 g) | 4.0 | 20.0 |

Population/Uncontrolled Environments are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

2.4. Equipments Used during the Test

| Test Equipment | Manufacturer | Type/Model | Serial Number | Calibration | |

3. SAR MEASUREMENTS SYSTEM CONFIGURATION

3.1. SAR Measurement Set-up

The OPENSAR system for performing compliance tests consist of the following items:

A standard high precision 6-axis robot (KUKA) with controller and software.

KUKA Control Panel (KCP)

A dosimetric probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with a Video Positioning System(VPS).

The stress sensor is composed with mechanical and electronic when the electronic part detects a change on the electro-mechanical switch, It sends an “Emergency signal” to the robot controller that to stop robot’s moves

A computer operating Windows XP.

OPENSAR software

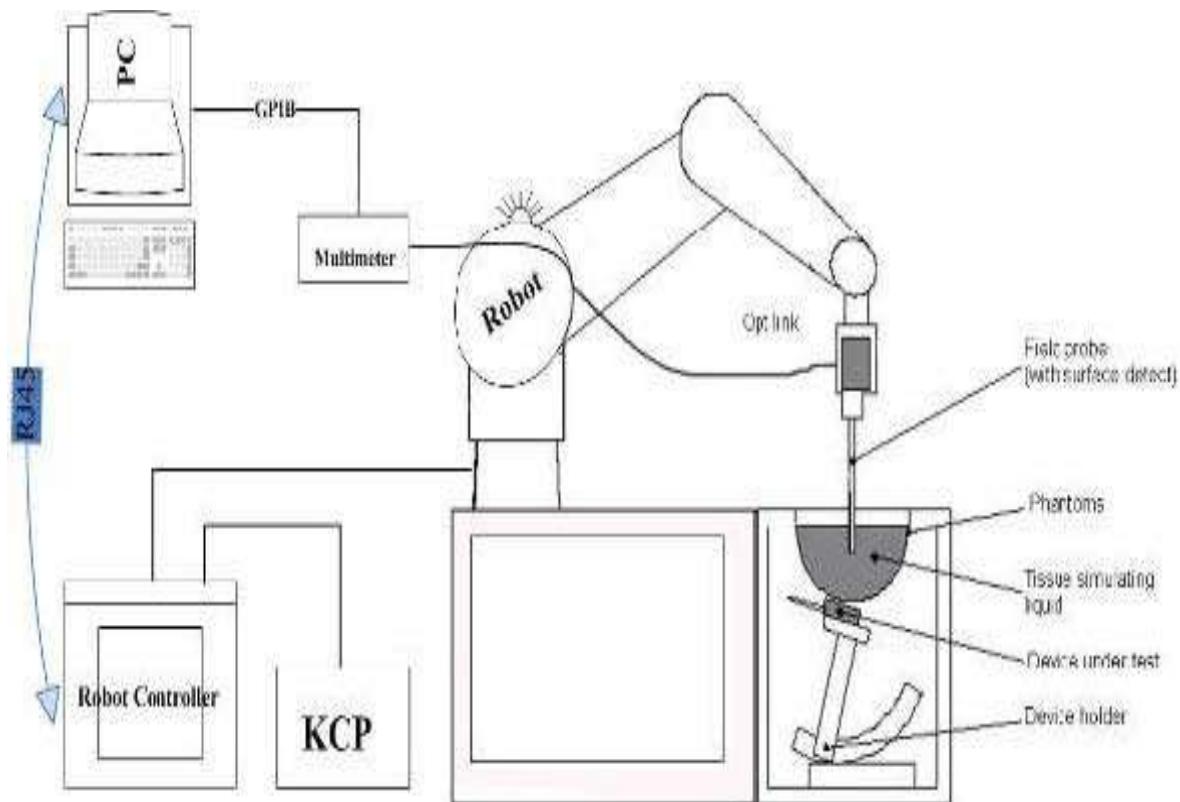

Remote control with teaches pendant and additional circuitry for robot safety such as warning lamps, etc.

The SAM phantom enabling testing left-hand right-hand and body usage.

The Position device for handheld EUT

Tissue simulating liquid mixed according to the given recipes .

System validation dipoles to validate the proper functioning of the system.

3.2. OPENSAR E-field Probe System

The SAR measurements were conducted with the dosimetric probe EP220 (manufactured by SATIMO), designed in the classical triangular configuration and optimized for dosimetric evaluation.

Probe Specification

Construction Symmetrical design with triangular core

Interleaved sensors

Built-in shielding against static charges

PEEK enclosure material (resistant to organic solvents, e.g., DGBE)

Calibration ISO/IEC 17025 calibration service available.

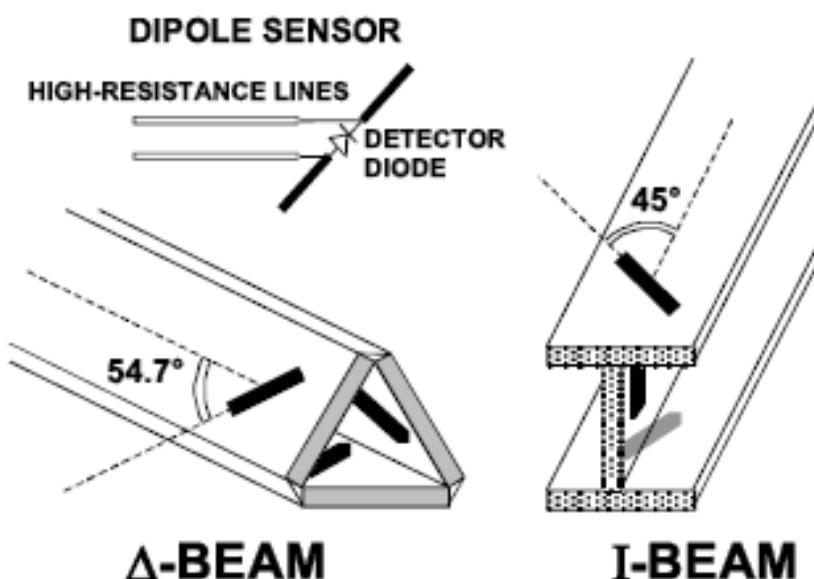

| | |
|---------------|--|
| Frequency | 700 MHz to 3 GHz; Linearity: 0.25dB (700 MHz to 3GHz) |
| Directivity | 0.25 dB in HSL (rotation around probe axis) 0.5 dB in tissue material (rotation normal to probe axis) |
| Dynamic Range | 0.01W/kg to > 100 W/kg; Linearity: 0.25 dB |
| Dimensions | Overall length: 330 mm (Tip: 16mm) Tip diameter: 5 mm (Body: 8 mm) Distance from probe tip to sensor centers: 2.5 mm |
| Application | General dosimetry up to 3 GHz Dosimetry in strong gradient fields Compliance tests of Mobile Phones |

Isotropic E-Field Probe

The isotropic E-Field probe has been fully calibrated and assessed for isotropicity, and boundary effect within a controlled environment. Depending on the frequency for which the probe is calibrated the method utilized for calibration will change.

The E-Field probe utilizes a triangular sensor arrangement as detailed in the diagram below:

3.3. Phantoms

The SAM Phantom SAM117 is constructed of a fiberglass shell integrated in a wooden table. The shape of the shell is in compliance with the specification set in IEEE P1528 and CENELEC EN62209-1 , EN62209-2:2010. The phantom enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents the evaporation of the liquid. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot.

System checking was performed using the flat section, whilst Head SAR tests used the left and right head profile sections. Body SAR testing also used the flat section between the head profiles.

SAM Twin Phantom

3.4. Device Holder

In combination with the Generic Twin Phantom SAM117, the Mounting Device enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeatedly positioned according to the FCC and CENELEC specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

Device holder supplied by SATIMO

3.5. Scanning Procedure

The procedure for assessing the peak spatial-average SAR value consists of the following steps

Power Reference Measurement

The reference and drift jobs are useful jobs for monitoring the power drift of the device under test in the batch process. Both jobs measure the field at a specified reference position, at a selectable distance from the phantom surface. The reference position can be either the selected section's grid reference point or a user point in this section. The reference job projects the selected point onto the phantom surface, orients the probe perpendicularly to the surface, and approaches the surface using the selected detection method.

Area Scan

The area scan is used as a fast scan in two dimensions to find the area of high field values, before doing a finer measurement around the hot spot. The sophisticated interpolation routines implemented in OPENSAR software can find the maximum locations even in relatively coarse grids. The scan area is defined by an editable grid. This grid is anchored at the grid reference point of the selected section in the phantom. When the area scan's property sheet is brought-up, grid was at 15 mm by 15 mm and can be edited by a user.

Zoom Scan

Zoom scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The default zoom scan measures 7 x 7 x 7 points within a cube whose base faces are centered around the maximum found in a preceding area scan job within the same procedure. If the preceding Area Scan job indicates more than one maximum, the number of Zoom Scans has to be enlarged accordingly (The default number inserted is 1).

Power Drift measurement

The drift job measures the field at the same location as the most recent reference job within the same procedure, and with the same settings. The drift measurement gives the field difference in dB from the reading conducted within the last reference measurement. Several drift measurements are possible for one reference measurement. This allows a user to monitor the power drift of the device under test within a batch process. In the properties of the Drift job, the user can specify a limit for the drift and have OPENSAR software stop the measurements if this limit is exceeded.

3.6. Data Storage and Evaluation

Data Storage

The OPENSAR software stores the acquired data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files. The software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of incorrect parameter settings. For example, if a measurement has been performed with a wrong crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be re-evaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type ([V/m], [A/m], [°C], [mW/g], [mW/cm²], [dBrel], etc.). Some of these units are not available in certain situations or show meaningless results, e.g., a SAR output in a lossless media will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

Data Evaluation

The OPENSAR software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

| | | |
|--------------------|---------------------------|----------------------|
| Probe parameters: | - Sensitivity | Normi, ai0, ai1, ai2 |
| | - Conversion factor | ConvFi |
| | - Diode compression point | Dcp1 |
| Device parameters: | - Frequency | f |
| | - Crest factor | cf |
| Media parameters: | - Conductivity | σ |
| | - Density | ρ |

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the OPENSAR components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcpi}$$

With V_i = compensated signal of channel i ($i = x, y, z$)

U_i = input signal of channel i ($i = x, y, z$)

cf = crest factor of exciting field

$dcpi$ = diode compression point

From the compensated input signals the primary field data for each channel can be evaluated:

$$\text{E - fieldprobes : } E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

$$\text{H - fieldprobes : } H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

With V_i = compensated signal of channel i ($i = x, y, z$)

$Norm_i$ = sensor sensitivity of channel i ($i = x, y, z$)
[mV/(V/m)2] for E-field Probes

$ConvF$ = sensitivity enhancement in solution

a_{ij} = sensor sensitivity factors for H-field probes

f = carrier frequency [GHz]

E_i = electric field strength of channel i in V/m

H_i = magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1'000}$$

with SAR = local specific absorption rate in mW/g

E_{tot} = total field strength in V/m

σ = conductivity in [mho/m] or [Siemens/m]

ρ = equivalent tissue density in g/cm3

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.

3.7. Position of the wireless device in relation to the phantom

General considerations

This standard specifies two handset test positions against the head phantom – the “cheek” position and the “tilt” position.

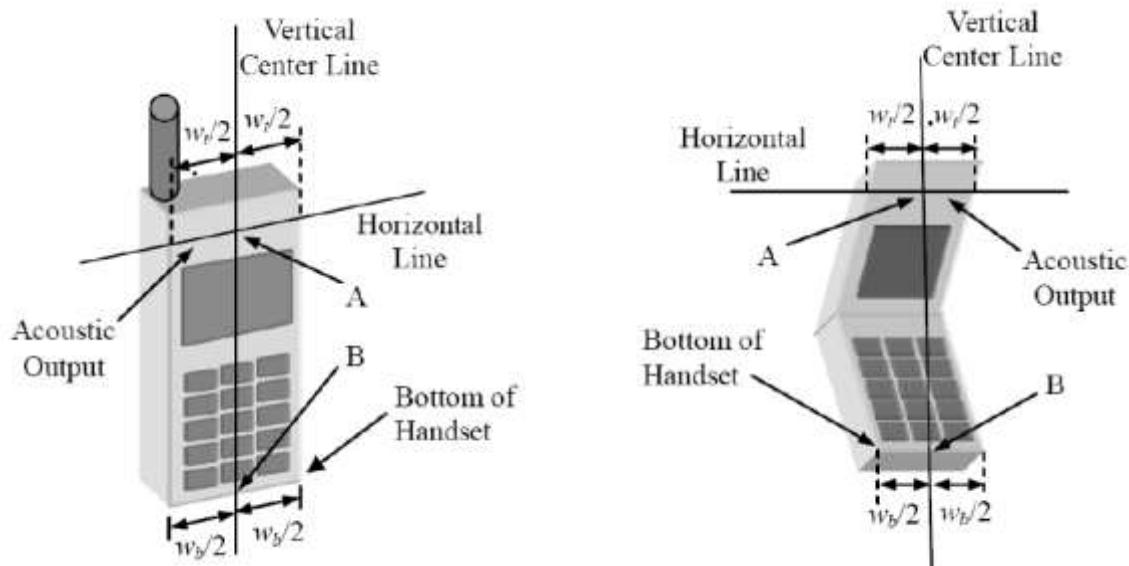

The power flow density is calculated assuming the excitation field as a free space field

$$P_{(pwe)} = \frac{E_{tot}^2}{3770} \text{ or } P_{(pwe)} = H_{tot}^2 \cdot 37.7$$

Where P_{pwe} =Equivalent power density of a plane wave in mW/cm2

E_{tot} =total electric field strength in V/m

H_{tot} =total magnetic field strength in A/m

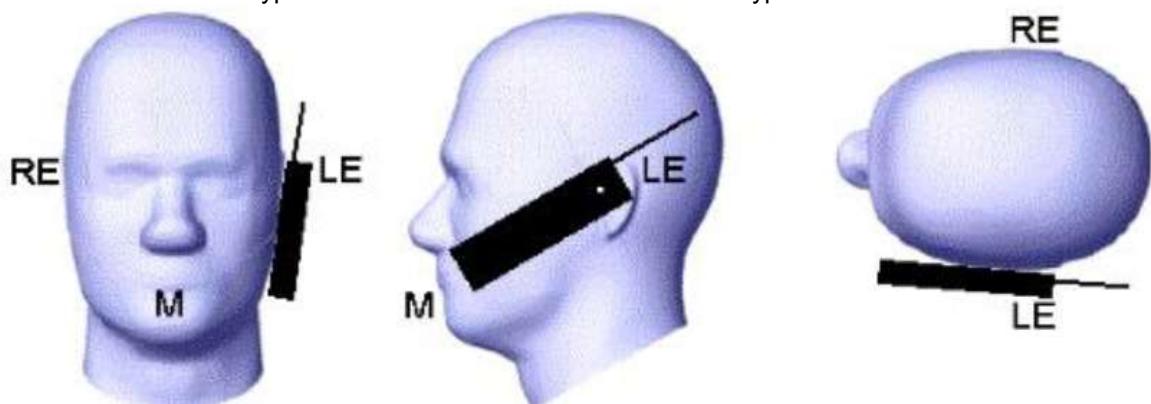

w_t : Width of the handset at the level of the acoustic

w_b : Width of the bottom of the handset

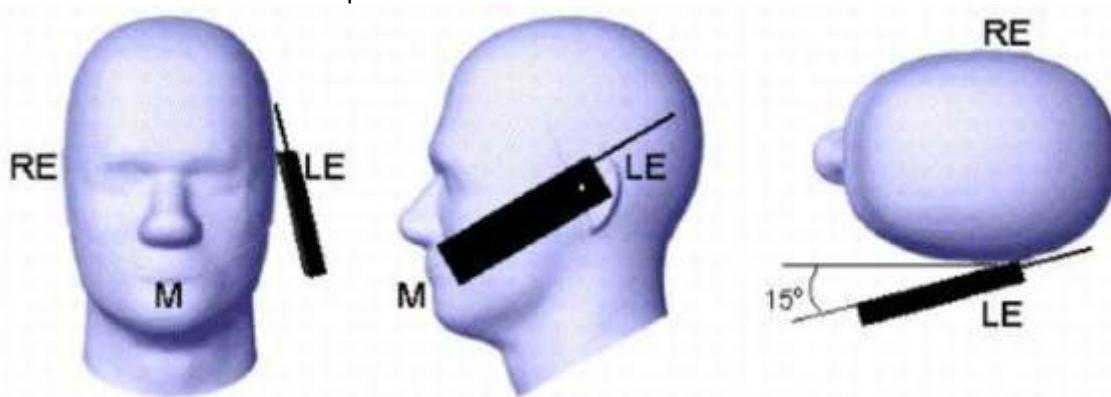

A: Midpoint of the width w_t of the handset at the level of the acoustic output

B: Midpoint of the width w_b of the bottom of the handset

Picture 1-a Typical "fixed" case handset Picture 1-b Typical "clam-shell" case handset

Picture 2 Cheek position of the wireless device on the left side of SAM

Picture 3 Tilt position of the wireless device on the left side of SAM

For body SAR test we applied to FCC KDB941225 D03v01, KDB447498 D01v06, KDB248227 D01v02r02, KDB616217 D04v01r02, KDB 447498 D01

3.8. Tissue Dielectric Parameters for Head and Body Phantoms

The liquid used for the frequency range of 100MHz-6G consisted of water, sugar, salt and Cellulose. The liquid has been previously proven to be suited for worst-case. The following Tableshows the detail solution. It's satisfying the latest tissue dielectric parameters requirements proposed by the IEEE 1528 and IEC 62209.

The simulating liquids should be checked at the beginning of a series of SAR measurements to determine of the determine of the dielectric parameter are within the tolerances of the specified target values.The measured conductivity and relative permittivity should be within $\pm 5\%$ of the target values.

The following materials are used for producing the tissue-equivalent materials.

Table 2. Composition of the Head Tissue Equivalent Matter

| Ingredients (% by weight) | Frequency (MHz) | | | | |
|---|--|--|---|--|--|
| | 835 | 900 | 1800 | 2000 | 2450 |
| Water | 41.45 | 40.92 | 16.33 | 54.89 | 46.70 |
| Sugar | 56.0 | 56.5 | / | / | / |

3.9. Dielectric Performance

Dielectric Performance of Head and Body Tissue Simulating Liquid

Measurement is made at temperature 22.0°C and relative humidity 52%.

Liquid temperature during the test: 22.0°C

Measurement Date: 835 MHz October 26, 2015; 1900 MHz October 27, 2015; 2450 MHz October 29, 2015

| Frequency (MHz) | Body Tissue | | Head Tissue | |
|--------------------|----------------|--------------|----------------|--------------|
| | σ (S/m) | ϵ_r | σ (S/m) | ϵ_r |
| 835 | 0.98 | 55.19 | 0.92 | 41.26 |
| 1900 | 1.53 | 53.28 | 1.43 | 40.15 |
| 2450 | 1.96 | 52.75 | 1.85 | 39.23 |

3.10. Basic SAR system validation requirements

The SAR system must be validated against its performance specifications before it is deployed. When SAR probe and system component or software are changed, upgraded or recalibrated, these must be validated with the SAR system(s) that operates with such component. Reference dipoles are used with the required tissue-equivalent media for system validation.

The detailed system validation results are maintained by each test laboratory, which are normally not required for equipment approval. Only a tabulated summary of the system validation status, according to the validation date(s), measurement frequencies, SAR probe and tissue dielectric parameters is required in the SAR report.

LCS lab has performed the system validation at 10/28/2014, and all the measured results within $\pm 10\%$ of the system calibrated SAR targets.

3.11. System setup

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of system in order to guarantee reproducible results. The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of component, but indicates situations where the system uncertainty is exceeded due to drift or failure.

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave that comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

3.12. Measurement procedure

The following procedure shall be performed for each of the test conditions

1. Measure the local SAR at a test point within 4 mm or less in the normal direction from the inner surface of the phantom.
2. Measure the two-dimensional SAR distribution within the phantom (area scan procedure). The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grip spacing of 20 mm for frequencies below 3 GHz and $(60/f [GHz])$ mm for frequencies of 3 GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and $\delta \ln(2)/2$ mm for frequencies of 3 GHz and greater, where δ is the plane wave skin depth and $\ln(x)$ is the natural logarithm. The maximum variation of the sensor-phantom surface shall be ± 1 mm for frequencies below 3 GHz and ± 0.5 mm for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than 5°. If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional measurement distance to the phantom inner surface shorter than the probe diameter, additional
3. From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that are not within the zoom-scan volume; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR limit. This is consistent with the 2 dB threshold already stated;
4. Measure the three-dimensional SAR distribution at the local maxima locations identified in step
5. The horizontal grid step shall be $(24 / f[\text{GHz}])$ mm or less but not more than 8 mm. The minimum zoom size of 30 mm by 30 mm and 30 mm for frequencies below 3 GHz. For higher frequencies, the minimum zoom size of 22 mm by 22 mm and 22 mm. The grip step in the vertical direction shall be $(8-f[\text{GHz}])$ mm or less but not more than 5 mm, if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell shall be $(12 / f[\text{GHz}])$ mm or less but not more than 4 mm, and the spacing between father points shall increase by an incremental factor not exceeding 1.5. When variable spacing is used, extrapolation routines shall be tested with the same spacing as used in measurements. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and $\delta \ln(2)/2$ mm for frequencies of 3 GHz and greater, where δ is the plane wave skin depth and $\ln(x)$ is the natural logarithm. Separate grids shall be centered on each of the local SAR maxima found in step c). Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved is the distance between the phantom surface and physical tip of the probe is larger than probe tip diameter. Other methods may utilize correction procedures for these boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe with respect to the flat phantom surface shall be less than 5°. If this cannot be achieved an additional uncertainty evaluation is needed.
6. Use post processing (e.g. interpolation and extrapolation) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.

4.OUTPUT POWER VERIFICATION

4.1. Test condition:

1. All test measurements carried out are traceable to national standard. The uncertainty of the measurement at a confidence level of approximately 95%(in the case where distributions are nomal),with a coverage factor of 2, In the range of 30MHz-40GHz is $\pm 1.5\text{dB}$.
2. Environment conditions:

| | |
|----------------------|----------|
| Temperature | 23°C |
| Relative Humidity | 53% |
| Atmospheric Pressure | 1019mbar |
3. Test Date:October 26, 2015- November 09, 2015
Tested By: Cherry

4.2. Test Procedure:

EUT radio output power measurement

1. The transmitter output port was connected to base station emulator.
2. Establish communication link between emulator and EUT and Set EUT to operate at maximum output power all the time.
3. Select lowest, middle, and highest channels for each band and different possible test mode.
4. Measure the conducted peak burst power and conducted average burst power from EUT antenna port.

4.3. Conducted Power Measurement

During the process of testing, the EUT was controlled via Rhode & Schwarz Digital Radio Communication tester (CMU200) to ensure the maximum power transmission and proper modulation. Max Conducted power measurement results and power drift from the 2G report by Shenzhen LCS Compliance Testing Laboratory Ltd.

Note: CMU200 measures GSM peak and average output power for active timeslots. for SAR the timebased average power is relevant. The difference in between depends on the duty cycle of the TDMA signal:

Source-based Time Averaged Bust Power calculation:

| Number of Time slot | 1 | 2 | 3 | 4 |
|---------------------|---------|---------|---------|---------|
| Duty cycle | 1:8 | 1:4 | 1:2.66 | 1:2 |
| Duty cycle factor | -9.03dB | -6.02dB | -4.26dB | -3.01dB |
| Crest factor | 8 | 4 | 2.66 | 2 |

Remark: Time slot duty cycle factor= $10 \times \log(1/\text{Time slot Duty Cycle})$

Source based time averaged power=Maximum bust averaged power (1 Uplink)-9.03dB

Source based time averaged power=Maximum bust averaged power (2 Uplink)-6.02dB

Source based time averaged power=Maximum bust averaged power (3 Uplink)-4.26dB

Source based time averaged power=Maximum bust averaged power (4 Uplink)-3.01dB

The signalling modes differ as follows:

| Mode | Code Scheme | Modulation | Mode | Code Scheme |
|------|-------------|------------|------|-------------|
| GPRS | CS1 to CS4 | GMSK | GPRS | CS1 to CS4 |

Conducted power measurement results for GSM850/PCS1900

| GSM850 | Conducted Power (dBm) | | |

| 4 Txslot | 24.19 | 24.26 | 24.17 | -3.01 | 21.18 | 21.25 | 21.16 |

Note:

1. The conducted power of PCS1900 is measured with RMS detector.
2. Frame-averaged output power was calculated from the measured burst-averaged output power by converting the slot powers into linear units and calculating the energy over 8 timeslots.
3. According the KDB941225 D03, the bolded GPRS 2TX mode was selected for SAR testing according to the highest frame-averaged output power table.

Conducted power measurements of Wifi 2.4GHz

| Mode | channel | Frequency (MHz) | Conducted output AVG power(dBm) | Test Rate Date |
|---------------|---------|-----------------|---------------------------------|----------------|
| 802.11b | 1 | 2412 | 16.56 | 1Mbps |
| | 6 | 2437 | 16.28 | 1Mbps |
| | 11 | 2462 | 16.62 | 1Mbps |
| 802.11g | 1 | 2412 | 15.26 | 6 Mbps |
| | 6 | 2437 | 14.89 | 6 Mbps |
| | 11 | 2462 | 14.70 | 6 Mbps |
| 802.11n(HT20) | 1 | 2412 | 14.45 | 6.5 Mbps |
| | 6 | 2437 | 14.36 | 6.5 Mbps |
| | 11 | 2462 | 14.25 | 6.5 Mbps |

Note:

According to the KDB248227, for WiFi 2.4G, highest average RF output power channel for the lowest date rate of 802.11b mode was selected for SAR evaluation. SAR test at higher date rates and higher order modulations(including 802.11g) were not required since the maximum average output powerfor each of these configurations is not more than 1/4dB higher than the tested channnel for the lowest date rate of 802.11b mode.

Conducted power measurement of Bluetooth V3.0

| Mode | channel | Frequency (MHz) | Conducted output power (dBm) |
|----------------|---------|-----------------|------------------------------|
| GFSK | 0 | 2402 | 4.78 |
| | 39 | 2441 | 4.81 |
| | 78 | 2480 | 5.07 |
| $\pi/4$ -DQPSK | 0 | 2402 | 4.08 |
| | 39 | 2441 | 4.17 |
| | 78 | 2480 | 4.39 |
| 8DPSK | 0 | 2402 | 4.07 |
| | 39 | 2441 | 4.17 |
| | 78 | 2480 | 4.38 |

Note:

According to KDB447498 D01v06 General RF Exposure Guidance standalone SAR test exclusion considerations,SAR test is not required in 100MHz to 6GHz at test separation distances $\leqslant 50\text{mm}$, if the output of EUT satisfy the flowing eqation:

$$[(\text{max power of channel,including tune-up tolerance,mW}) / (\text{min test separation distance,mm})] \cdot [f_{(\text{GHz})}^{1/2}] \leqslant 3.0$$

For 1-g SAR and $\leqslant 7.5$ for 10-g extremity SAR.

- a. $f_{(\text{GHz})}$ is the RF channel transmit frequency in GHz.
- b. Power and distance are rounded to the nearest mW and mm before calculation
- c. The result is rounded to one decimal place for comparison
- d. 3.5 and 7.5 are referred to as the numeric thresholds

5.SAR TEST RESULT

5.1. Test condition:

1. SAR Measurement

The distance between the EUT and the antenna of the emulator is more than 50cm and the output power radiated from the emulator antenna is at least 30dB less than the output power of EUT.

2. Measurement Uncertainty: See page 36and37 for detail

3. Environmental Conditions

| | |
|----------------------|----------|
| Temperature | 23°C |
| Relative Humidity | 53% |
| Atmospheric Pressure | 1019mbar |

4. Test Date: October 26, 2015- November 09, 2015

Test By: Cherry

5.2. Operation Mode

• According to KDB 447498 D01 v06 ,for each exposure position, if the highest 1-g SAR is ≤ 0.8 W/kg, testing for low and high channel is optional.

• Per KDB 865664 D01v01r04,for each frequency band, if the measured SAR is ≥ 0.8 W/Kg, testing for repeated SAR measurement is required , that the highest measured SAR is only to be tested. When the SAR results are near the limit, the following procedures are required for each device to verify these types of SAR measurement related variation concerns by repeating the highest measured SAR configuration in each frequency band.

(1) When the original highest measured SAR is ≥ 0.8 W/Kg, repeat that measurement once.

(2) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/Kg.

(3) Perform a third repeated measurement only if the original, first and second repeated measurement is \geq

1.5 W/Kg and ratio of largest to smallest SAR for the original, first and second measurement is ≥ 1.20 .

• Body-worn exposure conditions are intended to voice call operations, therefore GSM voice call mode is selected to be test.

(1)the procedures explained in footnote 11 of the standardmay be applied to reduce SAR test requirements for
(2) when multiple slots can be used, the device should betested to account for the maximum source-based time-averaged output power.

(3) when the 1-gSAR is ≤ 0.8 W/kg, testing for low and high channel is optional.

• Maximum Scaling SAR in order to calculate the Maximum SAR values to test under the standard Peak Power, Calculation method is as follows:

Maximum Scaling SAR =tested SAR (Max.) \times [maximum turn-up power (mw)/ maximum measurement output power(mw)]

5.3. SAR summary Test result

Next to Mouth SAR Data

1-g SAR:

GSM Head SAR

| Frequency | | Test Position | Test Mode | SAR 1g(W/kg) | Power Drift (%) | Conducted Power (dBm) | Tune-up Power (dBm) | Scaled SAR 1g(W/kg) | Limit 1g(W/kg) |
|-----------|---------|---------------|---------------|--------------|-----------------|-----------------------|---------------------|---------------------|----------------|
| MHz | Channel | | | | | | | | |
| 836.6 | 190 | Front(10mm) | GSM850/Voice | 0.149 | 1.58 | 32.71 | 33.00 | 0.201 | 1.60 |

- 2.Per KDB 447498 D01v06,next to the mouth use is evaluated with the front of the device position at 10mm From a flat phantom filled with head tissue-equivalent medium.
- 3.Per KDB 447498 D01v06, Next to the mouth exposure requies 1-g SAR, and the wrist-wron condition requires 10-g extremity SAR
4. The result was tested under the lowest data rate 1Mbps for 802.11b.

Wrist-Worn SAR Data**10-g SAR :****GSM Wrist-Worn SAR**

| Frequency | | Test Position | Test Mode | SAR 10g(W/kg) | Power Drift (%) | Conducted Power (dBm) | Tune-up Power (dBm) | Scaled SAR 1g(W/kg) | Limit 10g(W/kg) |
|-----------|---------|---------------|------------------|---------------|-----------------|-----------------------|---------------------|---------------------|-----------------|
| MHz | Channel | | | | | | | | |
| 836.6 | 190 | Back(0mm) | GSM850(voice) | 0.905 | -1.63 | 32.71 | 33.00 | 0.967 | 4.0 |
| 836.6 | 190 | Back(0mm) | GSM850(2 slots) | 0.823 | -2.98 | 30.58 | 31.00 | 0.907 | 4.0 |
| 1880.0 | 661 | Back(0mm) | DCS1900(voice) | 0.418 | 2.56 | 29.79 | 30.00 | 0.439 | 4.0 |
| 1880.0 | 661 | Back(0mm) | DCS1900(2 slots) | 0.318 | 3.37 | 27.89 | 28.00 | 0.326 | 4.0 |

Note:

- 1.Wrist-wron exposure conditions are intended to voice call operations, therefore GSM voice call is selected to be tested.
- 2.Per KDB 447498 D01v06, for each exposure position , if the highest output channel Reported SAR $\leq 2.0\text{W/Kg}$, Other channel SAR testing is not necessary.
- 3.Per KDB 447498 D01v06, Next to the mouth exposure requies 1-g SAR, and the wrist-wron condition requires 10-g extremity SAR
- 4.The Multi-slot Classes of EUT is Class12 which has maximum 1 Downlink slots and 4 Uplink slots, the maximum active slots is 5, when perform the multiple slots scan, 1DL+2UL is the worse case base on the output power measurements above.

WIFI Wrist-Worn SAR

| Frequency | | Test Position | Test Mode | SAR 10g(W/kg) | Power Drift (%) | Conducted Power (dBm) | Tune-up Power (dBm) | Scaled SAR 1g(W/kg) | Limit 10g(W/kg) |
|-----------|---------|---------------|-----------|---------------|-----------------|-----------------------|---------------------|---------------------|-----------------|
| MHz | Channel | | | | | | | | |
| 2437.0 | 6 | Back(0mm) | 802.11b | 0.881 | -1.24 | 16.28 | 17.00 | 1.040 | 4.0 |

Note:

- 1.Per KDB 447498 D01v06, for each exposure position , if the highest output channel Reported SAR $\leq 2.0\text{W/Kg}$, Other channel SAR testing is not necessary.
- 2.Per KDB 447498 D01v06, Next to the mouth exposure requies 1-g SAR, and the wrist-wron condition requires 10-g extremity SAR
3. The result was tested under the lowest data rate 1Mbps for 802.11b.

5.4. Test reduction procedure

Simultaneous multi-band transmission

The following tables list information which is relevant for the decision if a simultaneous transmit evaluation is necessary according to FCC KDB447498D01v06 General RF Exposure Guidance.

Figure 1:The diagonal dimension of the DUT

Top side

Length: 283.0mm

Width: 50.0mm

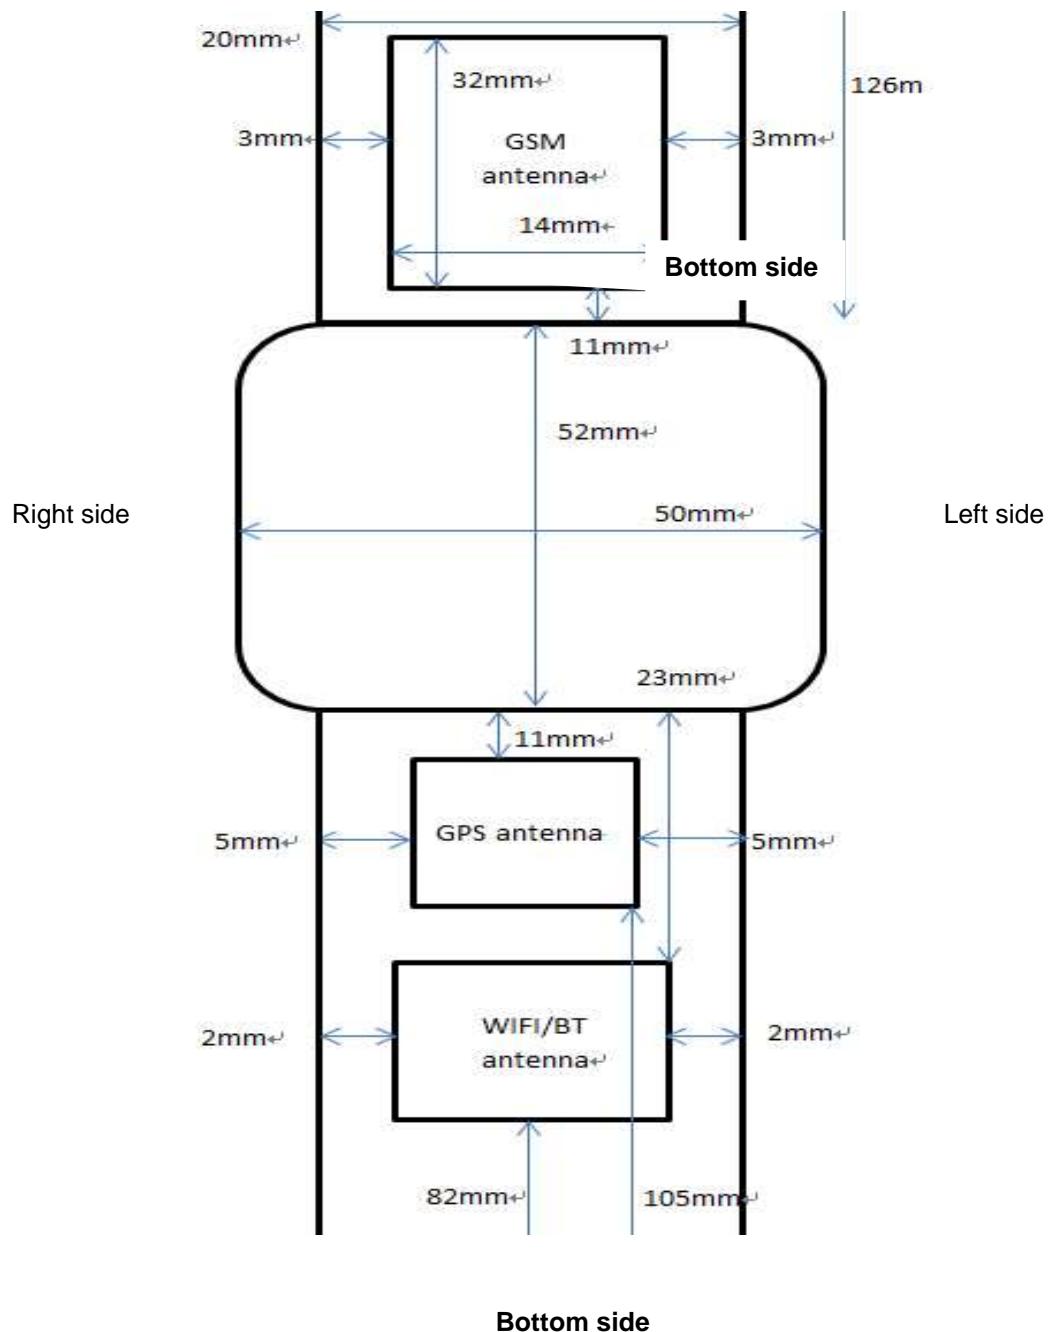

Figure1:The antenna position of the DUT

Simultaneous Transmission SAR Analysis

| No | Applicable Simultaneous Transmission Combination |
|----|--|
| 1. | GSM+BT |
| 2. | GSM+WiFi |

Note:1) WLAN2.4GHz and Bluetooth share the same antenna, and cannot transmit simultaneously.

- 2) The Reported SAR summation is calculated based on the same configuration and test position.
- 3) Per KDB 447498 D01v06, simultaneous transmission SAR is compliant if,
 - a) Scalar SAR summation < 1.6W/kg.
 - b) SPLSR = (SAR1 + SAR2) 1.5 / (min. separation distance, mm), and the peak separation distance is determined from the square root of $\sqrt{[(x_1-x_2)^2 + (y_1-y_2)^2 + (z_1-z_2)^2]}$, where (x_1, y_1, z_1) and (x_2, y_2, z_2) are the coordinates of the extrapolated peak SAR locations in the zoom scan
 - c) If SPLSR ≤ 0.04 , simultaneously transmission SAR measurement
is not necessary
 - d) Simultaneously transmission SAR measurement, and the reported
multi-band SAR < 1.6W/kg
- 4) For simultaneous transmission analysis, Bluetooth SAR is estimated per
KDB 447498 D01v06 based on the formula below.
 - a) (max. power of channel, including tune-up tolerance, mW) / (min.
test separation distance, mm) $\cdot [\sqrt{f(\text{GHz})} / x]$ W/kg for test
separation distances ≤ 50 mm; where $x = 7.5$ for 1-g SAR, and $x = 18.75$ for 10-g SAR.
 - b) When the minimum separation distance is < 5 mm, the distance is
used 5mm to determine SAR test exclusion.
 - c) 0.4 W/kg for 1-g SAR and 1.0 W/kg for 10-g SAR, when the test
separation distances is > 50 mm.
 - d) Bluetooth estimated SAR is conservatively determined by 5mm
separation, for all applicable exposure positions.

5) BT's maximum turn up procedure conducted power is **5.07dBm(3.214 mW)** and the estimated SAR is listed below.

| Test position | Head(10mm) | Body-worn(0mm) |
|------------------------|------------|----------------|
| BT Estimated SAR(W/kg) | 0.067 | 0.054 |

For Bluetooth the Estimated SAR for Head at 10mm for estimate and 5mm to Estimated Body SAR

$$\text{Estimated SAR}_{\text{Head}} = ((3.214 \text{mW}) / 10 \text{mm}) * (1.5624 / 7.5) = 0.067 \text{W/Kg}$$

$$\text{Estimated SAR}_{\text{Body}} = ((3.214 \text{mW}) / 5 \text{mm}) * (1.5624 / 18.75) = 0.054 \text{W/Kg}$$

Next to Mouth SAR Data**1-g SAR:****GSM& WLAN Mode**

| Test Position | | GSM850 Reported SAR1g (W/Kg) | GSM1900 Reported SAR1g (W/Kg) | WLAN Reported SAR1g (W/Kg) | Summation Reported SAR(1g) (W/kg) | SAR –to-peak-location Separation Ratio | Simultaneous Measurement Required? |
|---------------|-------|------------------------------|-------------------------------|----------------------------|-----------------------------------|--|------------------------------------|
| Head | Front | 0.149 | 0.132 | 0.179 | 0.328 | N/A | No |

GSM&BT Mode

| Test Position | | GSM850 Reported SAR1g (W/Kg) | GSM1900 Reported SAR1g (W/Kg) | Bluetooth Estimated SAR1g (W/Kg) | Summation Reported SAR(1g) (W/kg) | SAR –to-peak-location Separation Ratio | Simultaneous Measurement Required? |
|---------------|-------|------------------------------|-------------------------------|----------------------------------|-----------------------------------|--|------------------------------------|
| Head | Front | 0.149 | 0.132 | 0.067 | 0.216 | N/A | No |

Note: The above numeral summed SAR results is sufficient to determine that simultaneous transmission cases will not exceed the SAR limit and therefore simultaneous transmission SAR with volume scans is not required according to KDB447498 D01v06.

Wrist-Worn SAR Data**10-g SAR :****GSM& WLAN Mode**

| Test Position | | GSM850 Reported SAR10g (W/Kg) | GSM1900 Reported SAR10g (W/Kg) | WLAN Reported SAR10g (W/Kg) | Summation Reported SAR(10g) (W/kg) | SAR –to-peak-location Separation Ratio | Simultaneous Measurement Required? |
|---------------|-------------|-------------------------------|--------------------------------|-----------------------------|------------------------------------|--|------------------------------------|
| Body | Back-voice | 0.905 | 0.418 | 0.881 | 1.786 | N/A | No |
| | Back-4slots | 0.823 | 0.318 | 0.881 | 1.704 | N/A | No |

GSM&BT Mode

| Test Position | | GSM850 Reported SAR10g (W/Kg) | GSM1900 Reported SAR10g (W/Kg) | Bluetooth Estimated SAR10g (W/Kg) | Summation Reported SAR(10g) (W/kg) | SAR –to-peak-location Separation Ratio | Simultaneous Measurement Required? |
|---------------|-------------|-------------------------------|--------------------------------|-----------------------------------|------------------------------------|--|------------------------------------|
| Body | Back-voice | 0.905 | 0.418 | 0.054 | 0.959 | N/A | No |
| | Back-4slots | 0.823 | 0.318 | 0.054 | 0.877 | N/A | No |

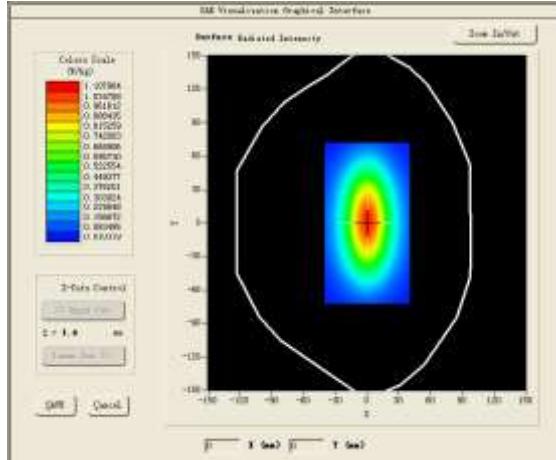

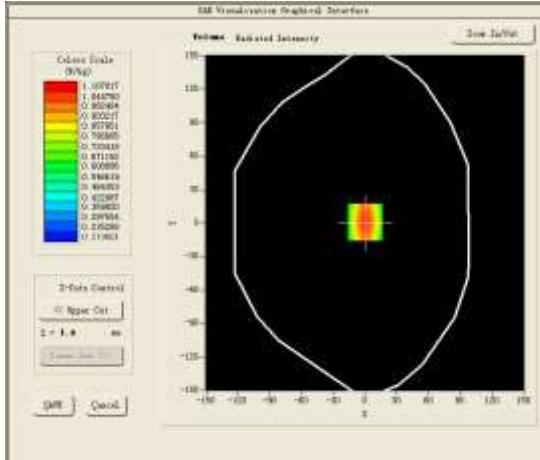

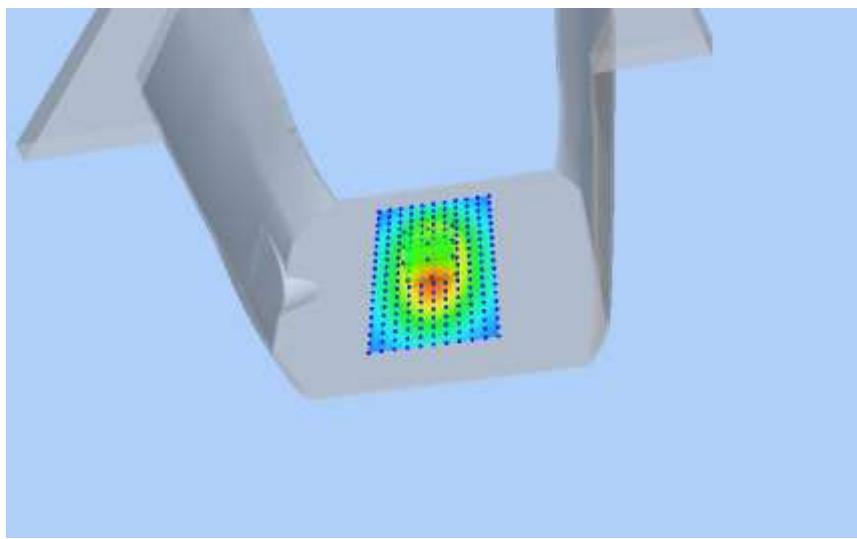

Note: The above numeral summed SAR results is sufficient to determine that simultaneous transmission cases will not exceed the SAR limit and therefore simultaneous transmission SAR with volume scans is not required according to KDB447498 D01v06.

5.5. Measurement Uncertainty (700MHz-3GHz)

| Uncertainty Component | Sec. | Tol (+- %) | Prob. Dist. | Div. | Ci (1g) | Ci (10g) | 1g Ui (+-%) | 10g Ui (+-%) | Vi |

6.CALIBRATION CERTIFICATES

SARTIMO Calibration Certificate-Extended Dipole Calibrations

According to KDB 450824 D02, Dipoles must be recalibrated at least once every three years; however, immediate re-calibration is required for following conditions. The test laboratory must ensure that the required supporting information and documentation have been included in the SAR report to qualify for extended 3-year calibration interval.

- 1) When the most recent return-loss, measured at least annually, deviates by more than 20% from the previous measurement (i.e. 0.2 of the dB value) or not meeting the required -20 dB return-loss specification
- 2) When the most recent measurement of the real or imaginary parts of the impedance, measured at least annually, deviates by more than 5 Ω from the previous measurement

Summary Result:

| SID835 | | | |
|---------------|-----------------|-----------------|-------------------------|
| Frquency | Return Loss(dB) | Requirement(dB) | Impedence |
| 835 | -24.46 | -20 | $55.4\Omega+2.4j\Omega$ |

| SID1900 | | | |
|----------------|-----------------|-----------------|-------------------------|
| Frquency | Return Loss(dB) | Requirement(dB) | Impedence |
| 1900 | -23.68 | -20 | $51.2\Omega+6.4j\Omega$ |

| SID 2450 | | | |
|-----------------|-----------------|-----------------|-------------------------|
| Frquency | Return Loss(dB) | Requirement(dB) | Impedence |
| 2450 | -25.61 | -20 | $44.9\Omega-0.9j\Omega$ |

| Model | SSE5 |
| Serial Number | SN 17/14 EP220 |
| Product Condition (new / used) | New |
| Frequency Range of Probe | 0.7 GHz-3GHz |
| Resistance of Three Dipoles at Connector | Dipole 1: R1=0.179 MΩ Dipole 2: R2=0.175 MΩ Dipole 3: R3=0.180 MΩ |

A yearly calibration interval is recommended.

2 PRODUCT DESCRIPTION**2.1 GENERAL INFORMATION**

Satimo's COMOSAR E field Probes are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards.

Figure 1 – Satimo COMOSAR Dosimetric E field Dipole

| | |
|--|--------|
| Probe Length | 330 mm |
| Length of Individual Dipoles | 4.5 mm |
| Maximum external diameter | 8 mm |
| Probe Tip External Diameter | 5 mm |
| Distance between dipoles / probe extremity | 2.7 mm |

3 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards provide recommended practices for the probe calibrations, including the performance characteristics of interest and methods by which to assess their affect. All calibrations / measurements performed meet the fore mentioned standards.

3.1 LINEARITY

The evaluation of the linearity was done in free space using the waveguide, performing a power sweep to cover the SAR range 0.01W/kg to 100W/kg.

COMOSAR E-FIELD PROBE CALIBRATION REPORT

Ref: ACR.287.1.14.SATU.A

3.2 SENSITIVITY

The sensitivity factors of the three dipoles were determined using a two step calibration method (air and tissue simulating liquid) using waveguides as outlined in the standards.

3.3 LOWER DETECTION LIMIT

The lower detection limit was assessed using the same measurement set up as used for the linearity measurement. The required lower detection limit is 10 mW/kg.

3.4 ISOTROPY

The axial isotropy was evaluated by exposing the probe to a reference wave from a standard dipole with the dipole mounted under the flat phantom in the test configuration suggested for system validations and checks. The probe was rotated along its main axis from 0 - 360 degrees in 15 degree steps. The hemispherical isotropy is determined by inserting the probe in a thin plastic box filled with tissue-equivalent liquid, with the plastic box illuminated with the fields from a half wave dipole. The dipole is rotated about its axis (0°–180°) in 15° increments. At each step the probe is rotated about its axis (0°–360°).

3.5 BOUNDARY EFFECT

The boundary effect is defined as the deviation between the SAR measured data and the expected exponential decay in the liquid when the probe is oriented normal to the interface. To evaluate this effect, the liquid filled flat phantom is exposed to fields from either a reference dipole or waveguide. With the probe normal to the phantom surface, the peak spatial average SAR is measured and compared to the analytical value at the surface.

4 MEASUREMENT UNCERTAINTY

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty associated with an E-field probe calibration using the waveguide technique. All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

| Uncertainty analysis of the probe calibration in waveguide | | | | | |
|--|-----------------------|--------------------------|------------|----|--------------------------|
| ERROR SOURCES | Uncertainty value (%) | Probability Distribution | Divisor | ci | Standard Uncertainty (%) |
| Incident or forward power | 3.00% | Rectangular | $\sqrt{3}$ | 1 | 1.732% |
| Reflected power | 3.00% | Rectangular | $\sqrt{3}$ | 1 | 1.732% |
| Liquid conductivity | 5.00% | Rectangular | $\sqrt{3}$ | 1 | 2.887% |
| Liquid permittivity | 4.00% | Rectangular | $\sqrt{3}$ | 1 | 2.309% |
| Field homogeneity | 3.00% | Rectangular | $\sqrt{3}$ | 1 | 1.732% |
| Field probe positioning | 5.00% | Rectangular | $\sqrt{3}$ | 1 | 2.887% |
| Field probe linearity | 3.00% | Rectangular | $\sqrt{3}$ | 1 | 1.732% |

1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

2 DEVICE UNDER TEST

| Device Under Test | |
|--------------------------------|----------------------------------|
| Device Type | COMOSAR 835 MHz REFERENCE DIPOLE |
| Manufacturer | Satimo |
| Model | SID835 |
| Serial Number | SN 07/14 DIP 0G835-303 |
| Product Condition (new / used) | New |

A yearly calibration interval is recommended.

3 PRODUCT DESCRIPTION

3.1 GENERAL INFORMATION

Satimo's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

Figure 1 – Satimo COMOSAR Validation Dipole

SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref. ACR.287.4.14.SATU.A

4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=2$, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz | 0.1 dB |

5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300 | 0.05 mm |

5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g | 20.3 % |
| 10 g | 20.1 % |

SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref ACR.287.4.14.SATU.A

7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

7.1 HEAD LIQUID MEASUREMENT

| Frequency MHz | Relative permittivity (ϵ_r') | | Conductivity (σ) S/m | |
|------------------|---|----------|-------------------------------|----------|
| | required | measured | required | measured |
| 300 | 45.3 ± 5 % | | 0.87 ± 5 % | |
| 450 | 43.5 ± 5 % | | 0.87 ± 5 % | |
| 750 | 41.9 ± 5 % | | 0.89 ± 5 % | |
| 835 | 41.5 ± 5 % | PASS | 0.90 ± 5 % | PASS |
| 900 | 41.5 ± 5 % | | 0.97 ± 5 % | |
| 1450 | 40.5 ± 5 % | | 1.20 ± 5 % | |
| 1500 | 40.4 ± 5 % | | 1.23 ± 5 % | |
| 1640 | 40.2 ± 5 % | | 1.31 ± 5 % | |
| 1750 | 40.1 ± 5 % | | 1.37 ± 5 % | |
| 1800 | 40.0 ± 5 % | | 1.40 ± 5 % | |
| 1900 | 40.0 ± 5 % | | 1.40 ± 5 % | |
| 1950 | 40.0 ± 5 % | | 1.40 ± 5 % | |
| 2000 | 40.0 ± 5 % | | 1.40 ± 5 % | |
| 2100 | 39.8 ± 5 % | | 1.49 ± 5 % | |
| 2300 | 39.5 ± 5 % | | 1.67 ± 5 % | |
| 2450 | 39.2 ± 5 % | | 1.80 ± 5 % | |
| 2600 | 39.0 ± 5 % | | 1.96 ± 5 % | |
| 3000 | 38.5 ± 5 % | | 2.40 ± 5 % | |
| 3500 | 37.9 ± 5 % | | 2.91 ± 5 % | |

7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| | |
|---|---|

SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.262.8.14.SATU.A

4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz | 0.1 dB |

5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300 | 0.05 mm |

5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g | 20.3 % |
| 10 g | 20.1 % |

7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

7.1 HEAD LIQUID MEASUREMENT

| Frequency MHz | Relative permittivity (ϵ_r') | | Conductivity (σ) S/m | |

7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

1 INTRODUCTION

This document contains a summary of the requirements set forth by the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards for reference dipoles used for SAR measurement system validations and the measurements that were performed to verify that the product complies with the fore mentioned standards.

2 DEVICE UNDER TEST

| Device Under Test | |
|--------------------------------|-----------------------------------|
| Device Type | COMOSAR 2450 MHz REFERENCE DIPOLE |
| Manufacturer | Satimo |
| Model | SID2450 |
| Serial Number | SN 07/14 DIP 2G450-306 |
| Product Condition (new / used) | New |

A yearly calibration interval is recommended.

3 PRODUCT DESCRIPTION

3.1 GENERAL INFORMATION

Satimo's COMOSAR Validation Dipoles are built in accordance to the IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards. The product is designed for use with the COMOSAR test bench only.

Figure 1 – Satimo COMOSAR Validation Dipole

SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR-287.8.14.SATU.A

4 MEASUREMENT METHOD

The IEEE 1528, OET 65 Bulletin C and CEI/IEC 62209 standards provide requirements for reference dipoles used for system validation measurements. The following measurements were performed to verify that the product complies with the fore mentioned standards.

4.1 RETURN LOSS REQUIREMENTS

The dipole used for SAR system validation measurements and checks must have a return loss of -20 dB or better. The return loss measurement shall be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards.

4.2 MECHANICAL REQUIREMENTS

The IEEE Std. 1528 and CEI/IEC 62209 standards specify the mechanical components and dimensions of the validation dipoles, with the dimensions frequency and phantom shell thickness dependent. The COMOSAR test bench employs a 2 mm phantom shell thickness therefore the dipoles sold for use with the COMOSAR test bench comply with the requirements set forth for a 2 mm phantom shell thickness.

5 MEASUREMENT UNCERTAINTY

All uncertainties listed below represent an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=2$, traceable to the Internationally Accepted Guides to Measurement Uncertainty.

5.1 RETURN LOSS

The following uncertainties apply to the return loss measurement:

| Frequency band | Expanded Uncertainty on Return Loss |
|----------------|-------------------------------------|
| 400-6000MHz | 0.1 dB |

5.2 DIMENSION MEASUREMENT

The following uncertainties apply to the dimension measurements:

| Length (mm) | Expanded Uncertainty on Length |
|-------------|--------------------------------|
| 3 - 300 | 0.05 mm |

5.3 VALIDATION MEASUREMENT

The guidelines outlined in the IEEE 1528, OET 65 Bulletin C, CENELEC EN50361 and CEI/IEC 62209 standards were followed to generate the measurement uncertainty for validation measurements.

| Scan Volume | Expanded Uncertainty |
|-------------|----------------------|
| 1 g | 20.3 % |
| 10 g | 20.1 % |

SAR REFERENCE DIPOLE CALIBRATION REPORT

Ref: ACR.287.8.14.SATU.A

7 VALIDATION MEASUREMENT

The IEEE Std. 1528, OET 65 Bulletin C and CEI/IEC 62209 standards state that the system validation measurements must be performed using a reference dipole meeting the fore mentioned return loss and mechanical dimension requirements. The validation measurement must be performed against a liquid filled flat phantom, with the phantom constructed as outlined in the fore mentioned standards. Per the standards, the dipole shall be positioned below the bottom of the phantom, with the dipole length centered and parallel to the longest dimension of the flat phantom, with the top surface of the dipole at the described distance from the bottom surface of the phantom.

7.1 HEAD LIQUID MEASUREMENT

| Frequency MHz | Relative permittivity (ϵ_r') | | Conductivity (σ) S/m | |
|------------------|---|----------|-------------------------------|----------|
| | required | measured | required | measured |
| 300 | 45.3 ±5 % | | 0.87 ±5 % | |
| 450 | 43.5 ±5 % | | 0.87 ±5 % | |
| 750 | 41.9 ±5 % | | 0.89 ±5 % | |
| 835 | 41.5 ±5 % | | 0.90 ±5 % | |
| 900 | 41.5 ±5 % | | 0.97 ±5 % | |
| 1450 | 40.5 ±5 % | | 1.20 ±5 % | |
| 1500 | 40.4 ±5 % | | 1.23 ±5 % | |
| 1640 | 40.2 ±5 % | | 1.31 ±5 % | |
| 1750 | 40.1 ±5 % | | 1.37 ±5 % | |
| 1800 | 40.0 ±5 % | | 1.40 ±5 % | |
| 1900 | 40.0 ±5 % | | 1.40 ±5 % | |
| 1950 | 40.0 ±5 % | | 1.40 ±5 % | |
| 2000 | 40.0 ±5 % | | 1.40 ±5 % | |
| 2100 | 39.8 ±5 % | | 1.49 ±5 % | |
| 2300 | 39.5 ±5 % | | 1.67 ±5 % | |
| 2450 | 39.2 ±5 % | PASS | 1.80 ±5 % | PASS |
| 2600 | 39.0 ±5 % | | 1.96 ±5 % | |
| 3000 | 38.5 ±5 % | | 2.40 ±5 % | |
| 3500 | 37.9 ±5 % | | 2.91 ±5 % | |

7.2 SAR MEASUREMENT RESULT WITH HEAD LIQUID

The IEEE Std. 1528 and CEI/IEC 62209 standards state that the system validation measurements should produce the SAR values shown below (for phantom thickness of 2 mm), within the uncertainty for the system validation. All SAR values are normalized to 1 W forward power. In bracket, the measured SAR is given with the used input power.

| | |
|---|---|
| Software | OPENSAR V4 |
| Phantom | SN 20/09 SAM71 |
| Probe | SN 18/11 EPG122 |
| Liquid | Head Liquid Values: ϵ_r' : 39.0 sigma : 1.77 |
| Distance between dipole center and liquid | 10.0 mm |
| Area scan resolution | dx=8mm/dy=8mm |
